

Type One Diabetes (T1D) is a life time incurable disease- With T1D you will not survive without taking multiple daily insulin injections- People with T1D need to know that for what ever reason if they run out of insulin it will be available- If you try to ration your insulin because you are running short of insulin you will be susceptible to Diabetic Ketoacidosis(DKA) which is an emergency situation requiring hospitalization- HB 37 will improve the safety and peace of mind for those with T1D -Anything that will improve the safety and affordability for those with T1D is the humane response for our fellow Ohio citizens- Thank you for your consideration-
