

The entire project to mitigate Climate Disruption is at stake with HB308. Ohioans should spend money on climate solutions that will work in the next 2 to 5 years. Developing Small Modular Nuclear Reactors (SMNRs) will take at least a decade and require — actually have already sucked up — billions of dollars that should be spent on real solutions; namely, making buildings and houses more efficient, installing rooftop and commercial solar, creating wind and thermal energy sources, using various battery storage; but ABOVE ALL preparing the electrical grid to accommodate real climate solutions.

To go down the money hole of untried, unlicensed, dangerous and First of a Kind, nuclear projects is the ultimate in legislative fiscal irresponsibility. It's not going to work to reduce our CO2 output and people can't afford the increased cost it will add to the monthly electricity bill.

REAL climate solutions are NOT radioactive!
