

Opposition to SB 294

SB 294 aims to declare a new energy siting policy for Ohio that heavily favors the oil and gas industry while suppressing renewable energy progress. The bill misleadingly labels fracked gas as clean energy, ignoring the fact that the extraction process releases significant methane. Methane is a greenhouse gas over 20 times more potent than carbon dioxide and its leakage at every stage makes it a driver of climate change rather than a green solution.

We should be transitioning to sustainable renewable energy and phasing out fossil fuels.
